

ABSTRACT

An optical component composed of a cured product of a crosslinkable resin containing a perfluorocyclohexane ring; a crosslinkable resin composition including a monomer containing a perfluorocyclohexane ring; the above optical component, which is obtained by curing, through a radical polymerization method, a crosslinkable resin composition including a polymer and/or copolymer containing a perfluorocyclohexane ring and a fluorine-containing monomer, or a crosslinkable resin composition including a fluorine-containing polymer and/or copolymer not containing a perfluorocyclohexane ring and a monomer containing a perfluorocyclohexane ring.
